## **DETAILED ACTION**

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

**Claims 28 and 30 are rejected under 35 U.S.C. 102(e) as being anticipated by Vogel (6873407).**

Referring to claims 28 and 30, Vogel shows a surveying instrument with a computer program that includes an image sensor (column 2-3), wherein imaging of an object point by the camera on the image sensor can be modeled by use of a camera model having a protection center (figure 5 and column 2-3), A display for displaying image based on image captured by the image sensor (column 8), controlling the display to display a mark indicating the sighting axis the sighting axis being defined by the projection center and the intersection point or point of closest approach of the tilting axis and the vertical axis (figures 2-5 and column 7-8).

**Claims 28 and 29 are rejected under 35 U.S.C. 102(e) as being anticipated by Huang “Calibration of the Wild P32 Camera using the Camera-ON-Theodolite method”.**

Referring to claims 28 and 29, Huang shows a surveying instrument having a camera with an image sensor (introduction and figure 1), wherein imaging of an object point by the camera on the image sensor can be modeled by use of a camera model having a protection center (figure 2), a display for displaying image based on image captured by the image sensor (figure 2), controlling the display to display a mark indicating the sighting axis the sighting axis being defined by the projection center and the intersection point or point of closest approach of the tilting axis and the vertical axis (pages 100-103).

***Allowable Subject Matter***

**Claims 1-27** are allowed.

***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Kacyra (6847462) shows a similar method for calibrating a surveying instrument that includes a base element and a camera that is able to change in elevation and azimuth.
